21-22 May, 2009

Rural –Urban Systems and Industrial Ecology: Case Studies in Japan and Asia

Osamu Saito

Waseda Institute for Advanced Study

Waseda University

Outline

1. Rural – Urban Systems through Biomass Utilization in Asia

- (1) Urban-Rural Linkages through Biomass Utilization in Asia
- (2) Key Issues on Rural Urban Systems in Asia

2. Changes in Biomass Material Flow

- (1) Biomass material flow in Vietnam's Mekong Delta
- (2) Biofuel production in Malaysia
- (3) Biomass material flow in Japan

3. Agricultural landscape and ecosystem services in Japan

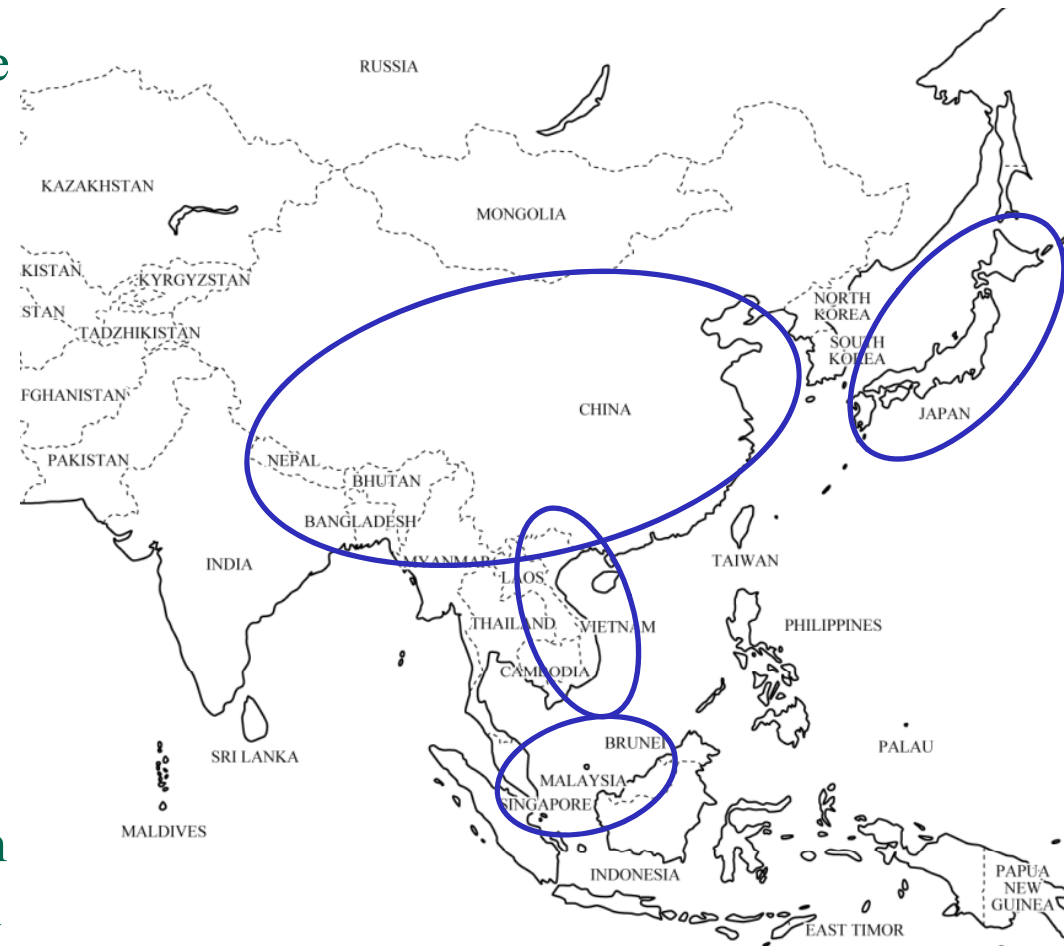

- (1) *Satoyama* (Japanese traditional agricultural landscape) and its ecosystem services in Japan
- (2) Changes in *Satoyama* and ecosystem services

4. Sustainability of Resort Industry in Japan

- (1) Resort development in the Tokyo Metropolitan Area
- (2) Redundant golf courses
- (3) Restructuring the redundant golf courses and its environmental and social impacts

Rural – Urban Systems through Biomass Utilization in Asia

- While the world-wide demand for biomass such as biofuel made of corn, sugarcane and oil palm is growing, it is predicted that unused agricultural residues and abandoned arable land may increase in developing countries due to changes in diet and rural farming systems.
- Biomass use matters relationship between rural and urban areas not only through material and energy exchanges, but also through history, culture, tradition and social context of each region or country.

Urban-Rural Linkages through Biomass Utilization:

Four Layers of Urban-Rural Linkage

Energy & Resources

Economy & Industry

Socio-Culture

Ecosystem & Environment

Urban Areas

Energy Consumption
Diet change
Organic Waste
Fertilizer & Chemicals
Machines & Equipments
Drinking Water

Secondary & Tertiary Industry
Oil Price Fluctuation
Trade Markets

Labor migration,
Informal population
Urbanization Sprawl
Globalization
Modern lifestyle

Conservation groups
Pollutants/Health
GHGs emissions
Heat Island

Rural Areas

Food
Agricultural Residues
Tree Plantation
Fuel wood
Forest & Timber Residues
Energy Crop Plantation
Agricultural Water

Primary Industry
Uncertainty & Seasonality
Modernization

Surplus Labor
Poverty
Tradition & Heritage
Regionalization/Localization
Aging
Health & Gender
Rural Landscape

Catchment Area
Soil degradation
CO₂ sink
Deforestation
Biodiversity
Abandoned land
Species Pool
Wildlife Habitat
Regulating Service

Transportation Systems

Biomass Industry

Biomass Utilization

Home Land Planning & Biomass Policy

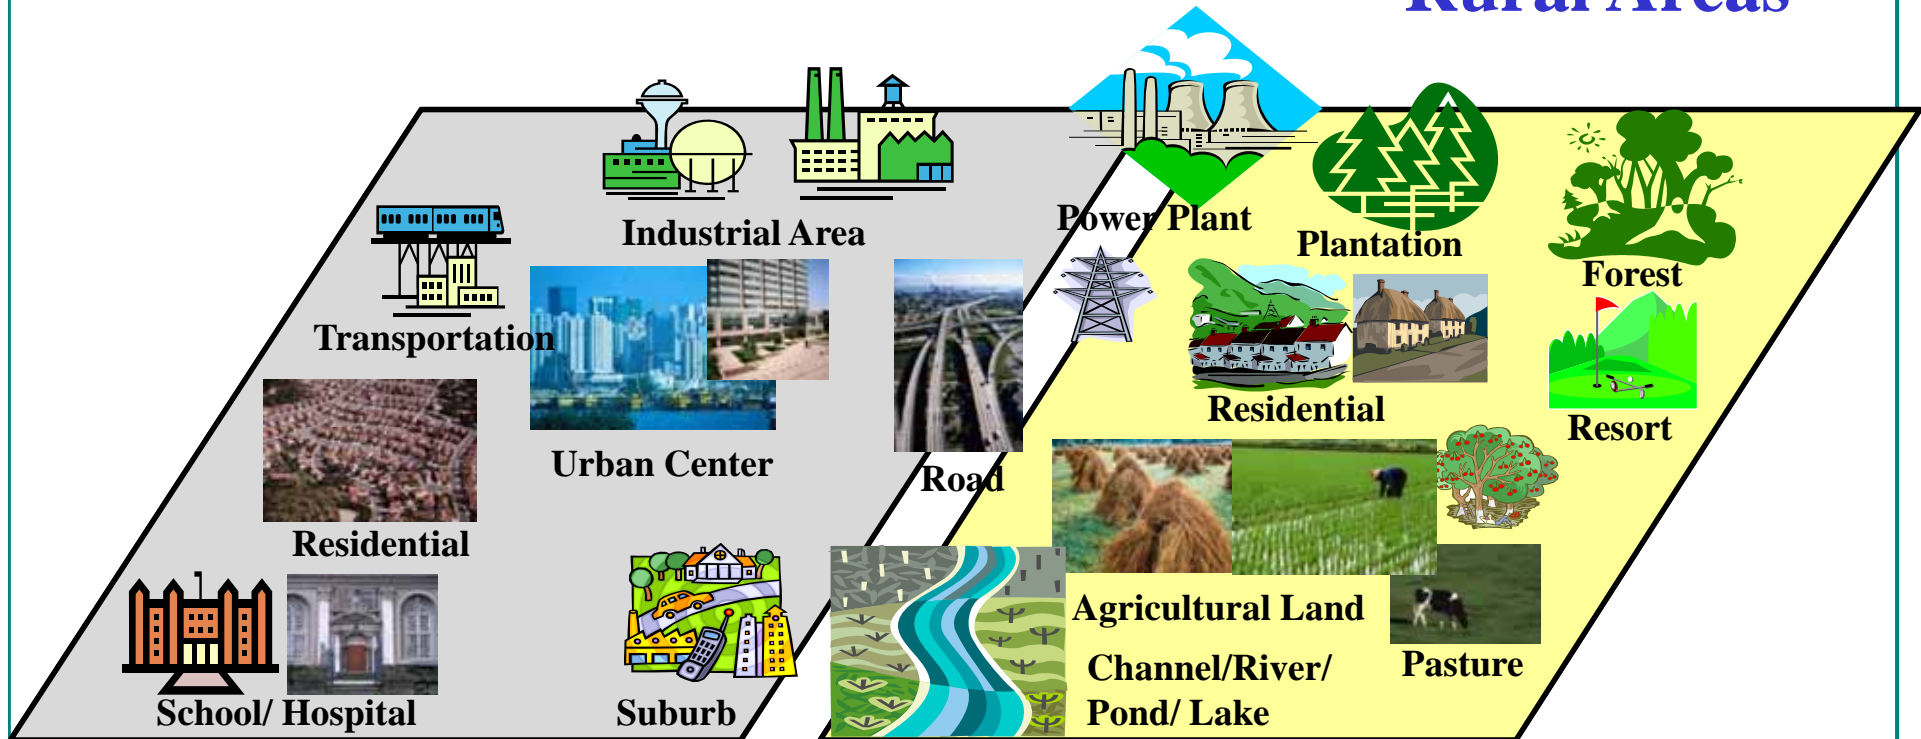

River Basin

Product Certification

In terms of Land Use:

Urban Areas

Rural Areas

Issues

Four Layers of Urban-Rural Linkage

Energy & Resources

- 1) **Food and Bioenergy**
- 2) **Waste and Bioenergy**
- 3) **Water**
- 4) **Motorization**

Economy & Industry

- 5) **Economic Growth and Industrial Structure**
- 6) **Globalization and Regionalization**
- 7) **Technology Development and Diffusion**

Socio-Culture

- 8) **Individualism and Social Integration**
- 9) **Urbanization and Symbolic Rurality**
- 10) **Rural Abandonment**

Ecosystem & Environment

- 11) **Coheision and Fragmentation**
- 12) **Environmental Sustainability**
- 13) **Regulation and Certification**

Major issues

Key Issues regarding Rural-Urban Systems:

Common issues → Energy and resources management, globalization and economic growth (Economy & Industry)

Key issues for Japan

→ Rural abandonment, symbolic rurality, fragmentation, redundancy of rural infrastructures, accumulated large forest biomass stock and high dependency on timber and food imports

Key issues for China

→ Increase in biomass waste (agricultural residues and MSW), water shortage, motorization, industrial structure and lifestyle changes, rapid urbanization and labor migration from poor rural areas

Key issues for Vietnam

→ Similar to China, but almost a decade behind China. Food, waste, motorization (especially motorcycles), industrial structure, urban sprawl and basic infrastructure construction and technology diffusion

2. Changes in Biomass Material Flow

(1) Biomass material flow in Vietnam's Mekong Delta

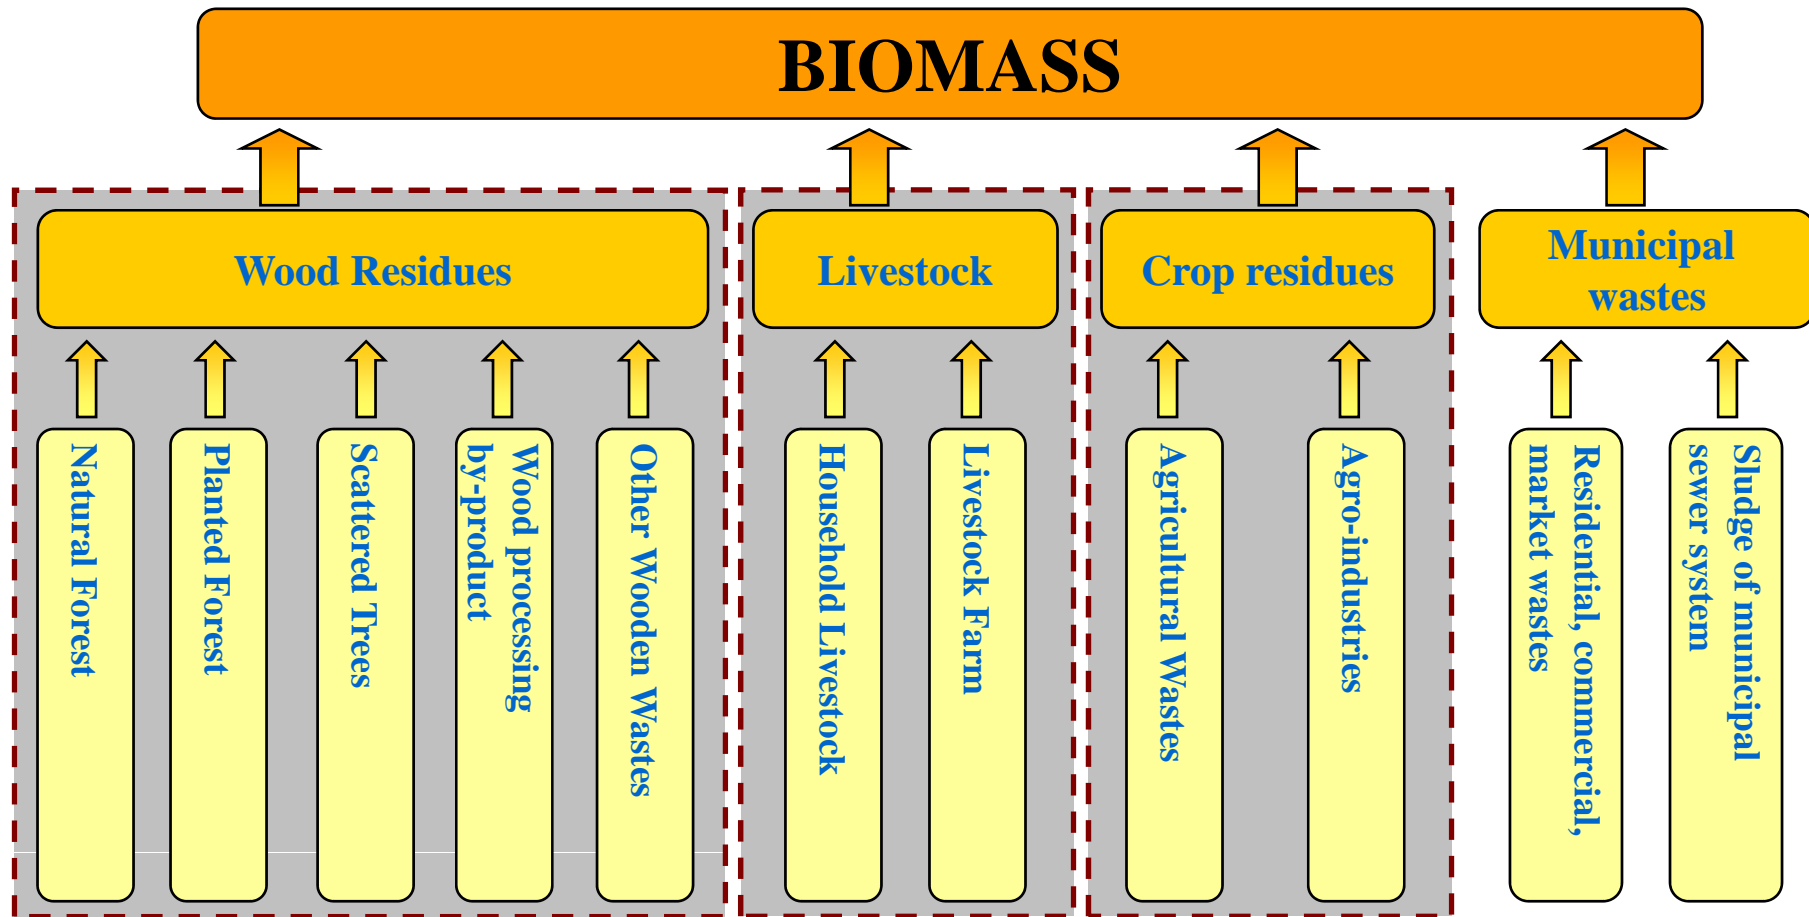

(2) Biofuel production in Malaysia

(3) Biomass material flow in Japan

(1) Material flow of biomass in Vietnam's Mekong Delta

Major biomass sources in Vietnam

3 main biomass sources in Mekong Delta

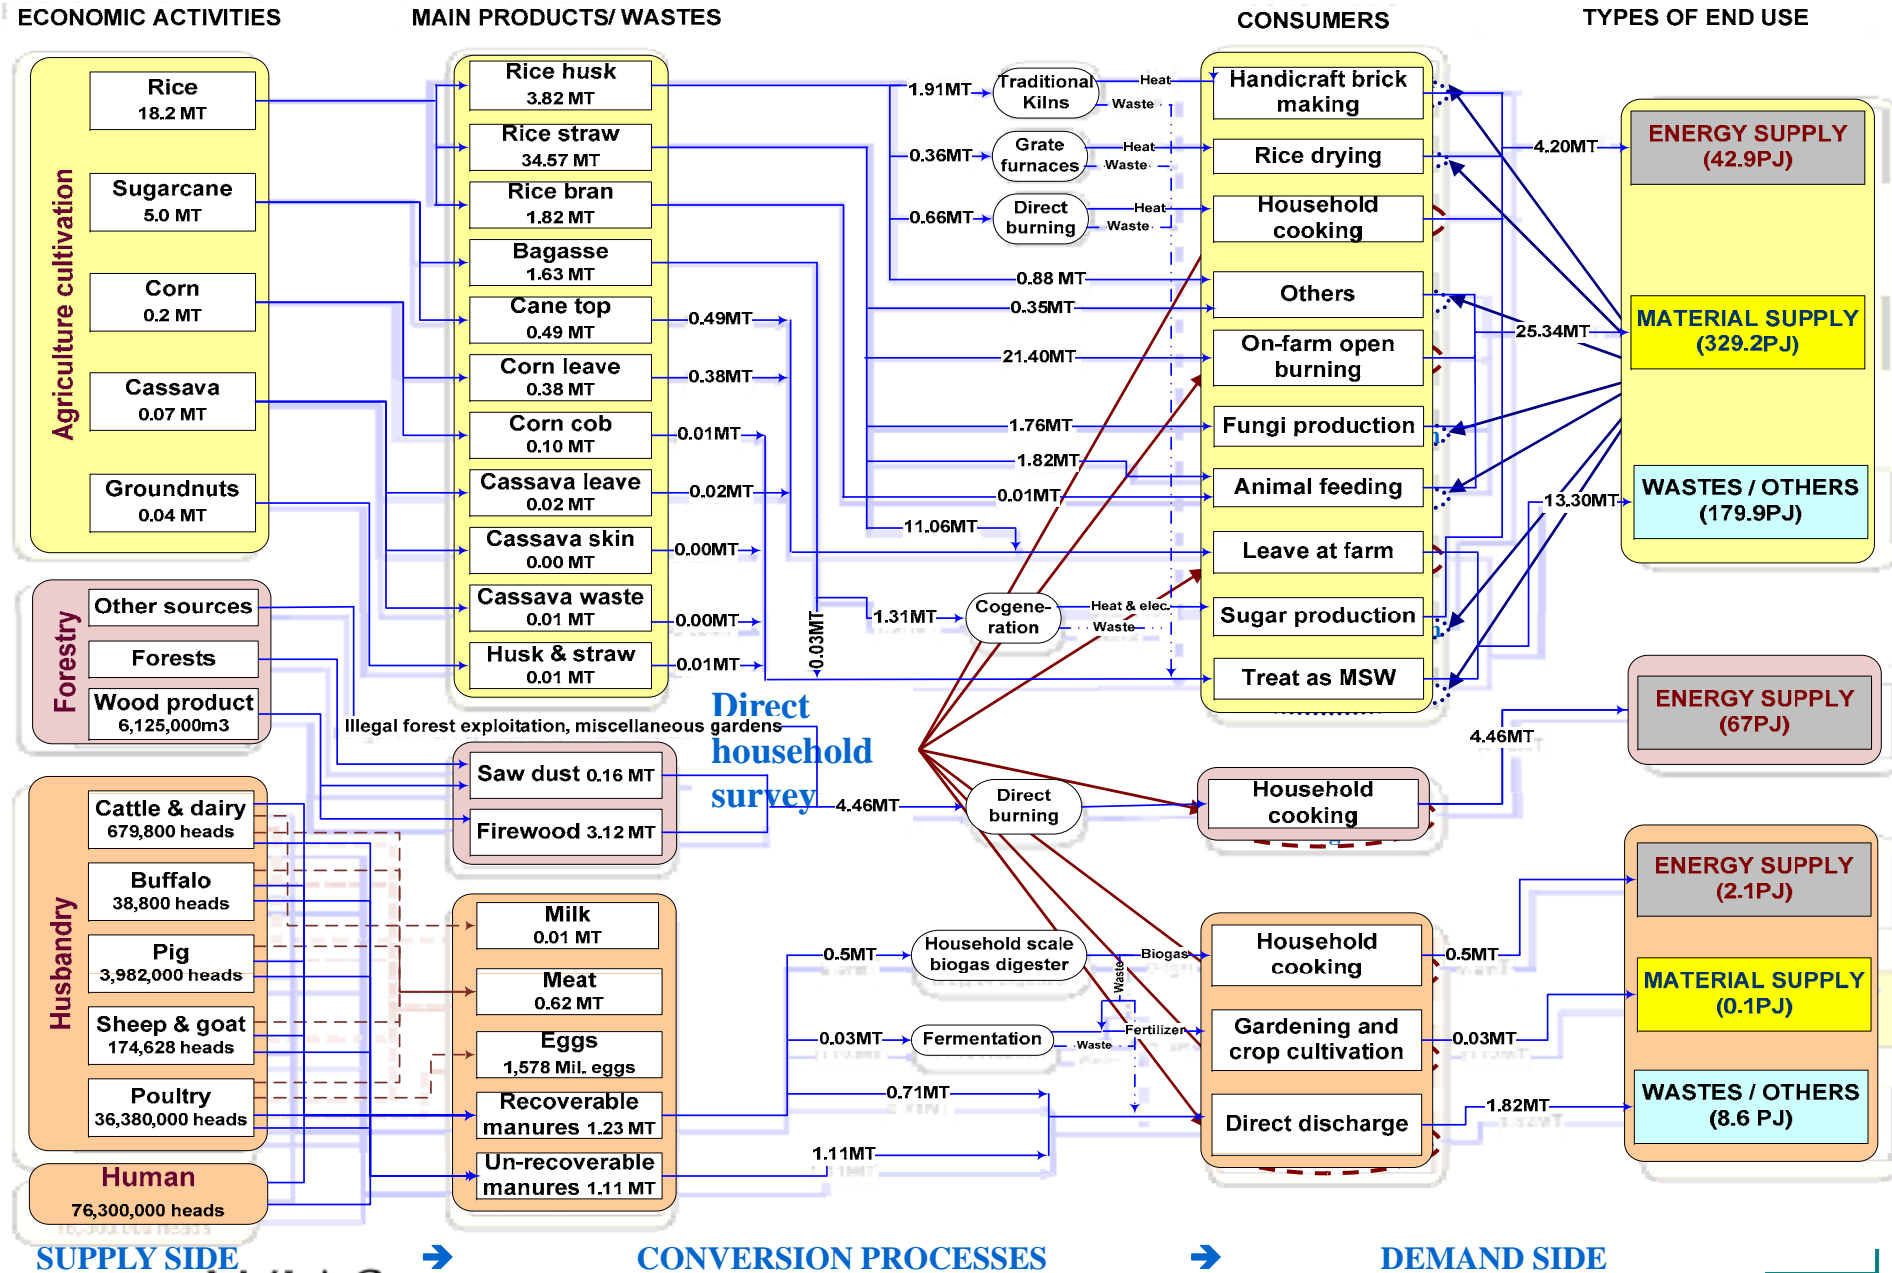

Biomass energy potential in Mekong Delta

- 91% energy potential comes from agricultural residues
- 8% from firewood and forest residues
- 1% from human and animal wastes

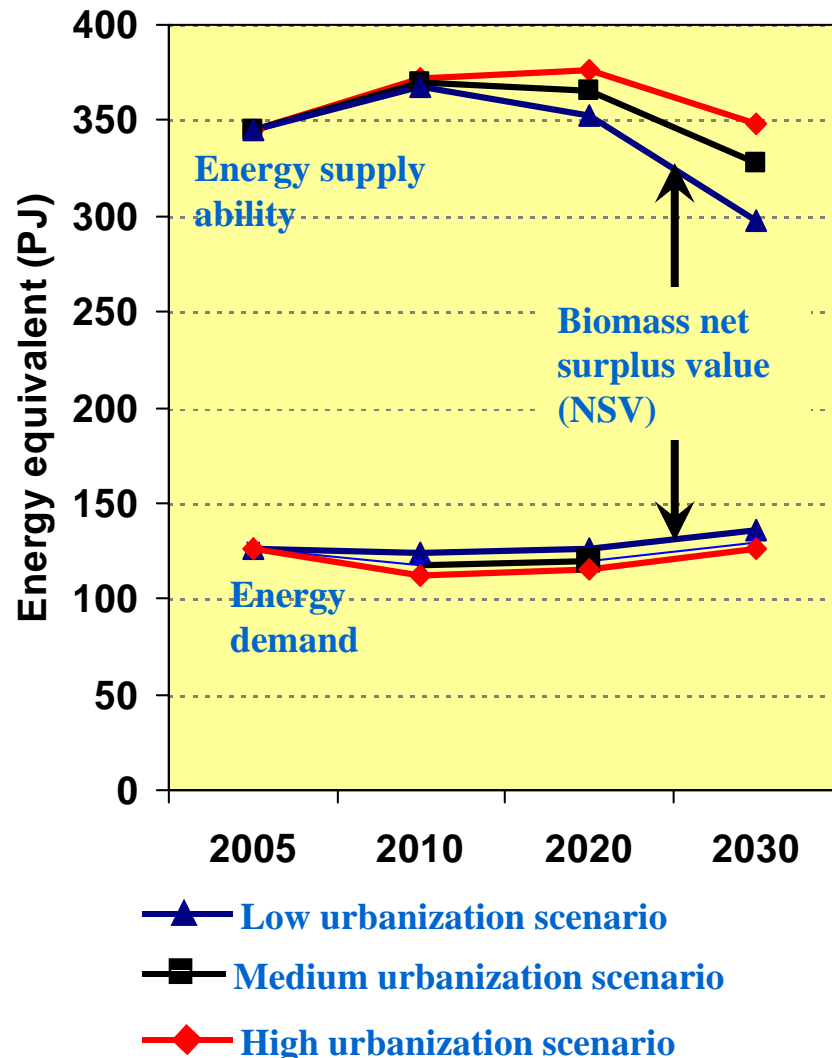

■ Agricultural residues
 ■ Firewood & forestry residues
 ■ Human & husbandry manures

Biomass material flow in Mekong Delta

Biomass potential and consumption projection

Biomass energy demand - supply

Rice husk and rice straw are not fully utilized

- *low density* characteristic
- *Scattered* sources
- ➔ Difficult to collect, handle and store
- ➔ High transportation cost
- Insufficient handling and utilization ➔ negative impacts on the environment

➔ Depending on the extent of urbanization, biomass-based energy supply will decrease by 3.1 – 22.2% in 2030

(2) Biofuel production in Malaysia

- ◆ Palm oil is the most produced vegetable oil in the world in terms of production – 37 million tonnes (Oil World, 2006)
- ◆ Malaysia and Indonesia account for 86% of global palm oil production

Roundtable on Sustainable Palm Oil (RSPO)

RSPO's Principles and Criteria (P&C):

1. Commitment to transparency
2. Compliance with application laws and regulations
3. Commitment to long-term economic and financial viability
4. Use of appropriate best practices by growers and millers
5. Environmental responsibility and conservation of natural resources and biodiversity
6. Responsible consideration for employees and for individuals and communities affected by growers and mills
7. Responsible development of new plantings
8. Commitment to continuous improvement in key areas of activity

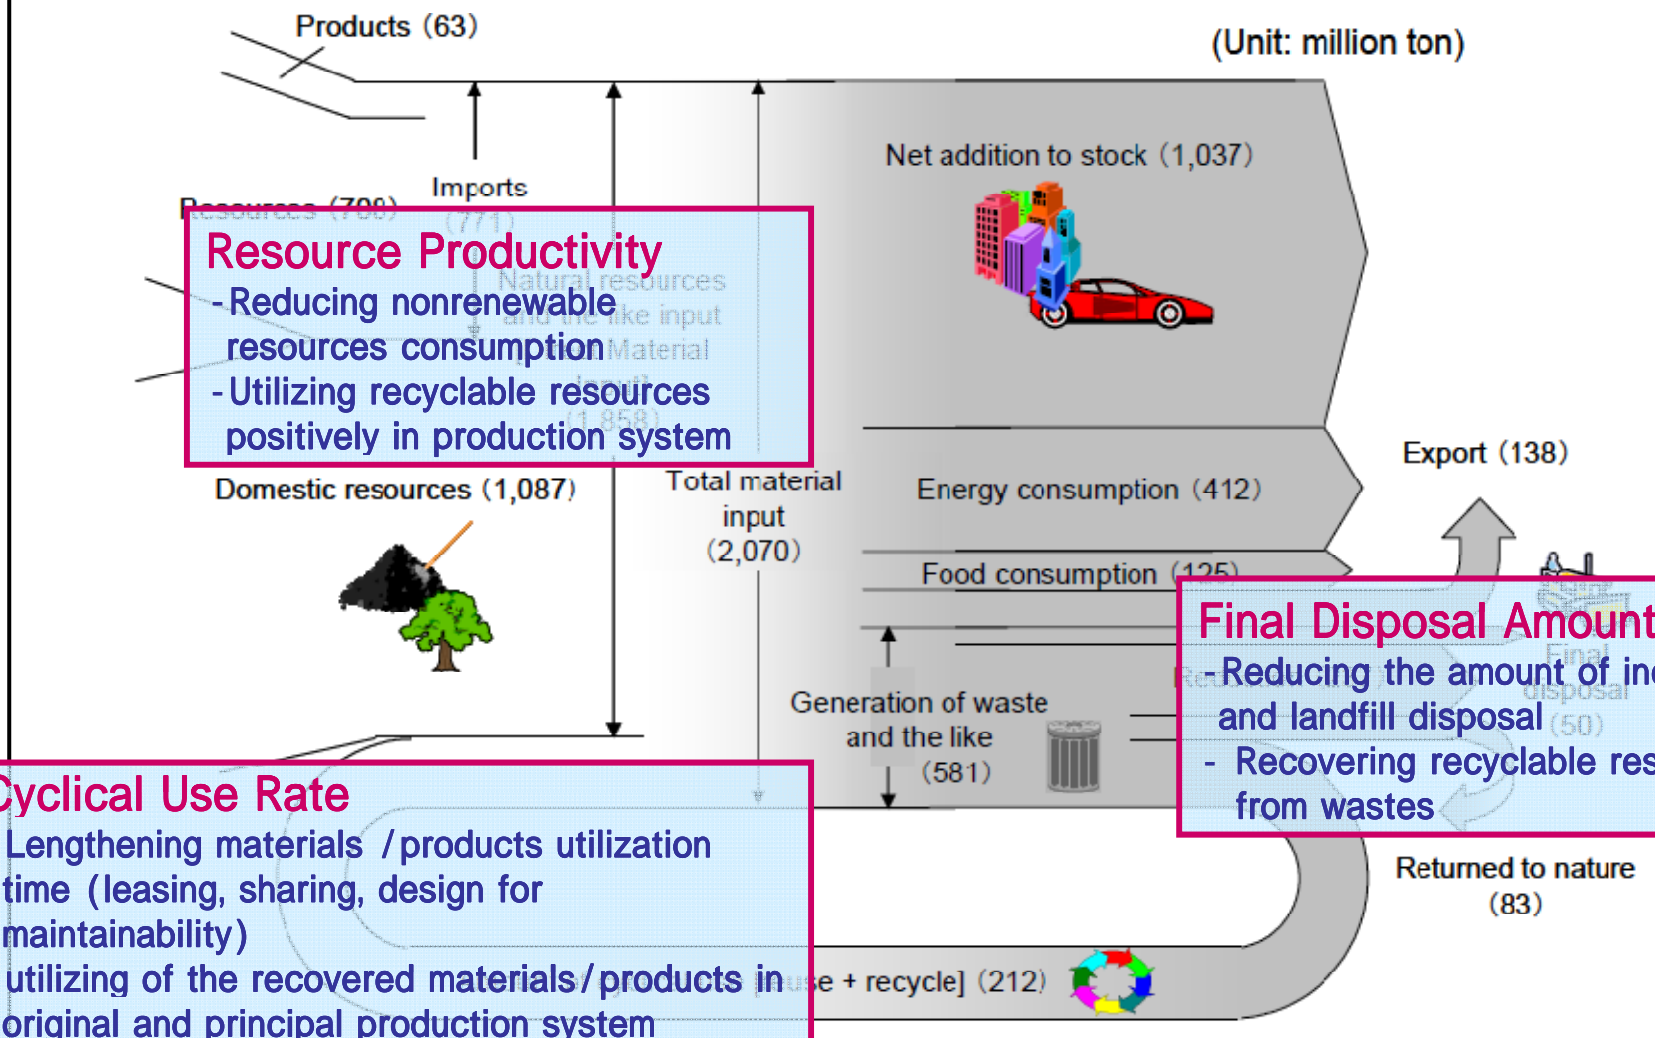

- ◆ **RSOP certified palm oil** entered market in September 2008 and close to **1.5 million tones** are expected to be in the market by end 2008. The volume will reach 2 million tones by the end of 2009, which accounts for **5 %** of the world palm oil production .
- ◆ RSPO membership: 264 Ordinary and 92 Affiliate members (as of May 2009), accounting for **40% of palm oil production** in the world

Volumes of RSPO certified palm oil to April 2009

Company	Country	Mills	CPO (mt)	PK (mt)
United Plantations Berhad	Malaysia	6	185,324	50,195
New Britain Palm Oil (NBPOL)	PNG	4	257,338	62,181
Sime Darby	Malaysia	5	218,636	52,823
Kulim Bhd	Malaysia	3	88,914	24,943
Wilmar/PPB Oil Palms	Malaysia	3	122,900	27,400
PT Musim Mas	Indonesia	2	135,000	31,250
IOI Corp	Malaysia	1	70,000	16,500
SIPEF/ Hargy Oil Palms Ltd	PNG	2	180,122	41,000
Cargill/PT Hindolie	Indonesia	2	51,344	12,122
Kuala Lumpur Kepong-KDC	Malaysia	2	92,000	22,000
PT London Sumatra	Indonesia	4	169,480	PKO
TOTAL		34	1,571,056	340,414

(3) Material flow of biomass and its changes in Japan

The material flow accounts for FY2002

Resource Productivity

- Reducing nonrenewable resources consumption
- Utilizing recyclable resources positively in production system

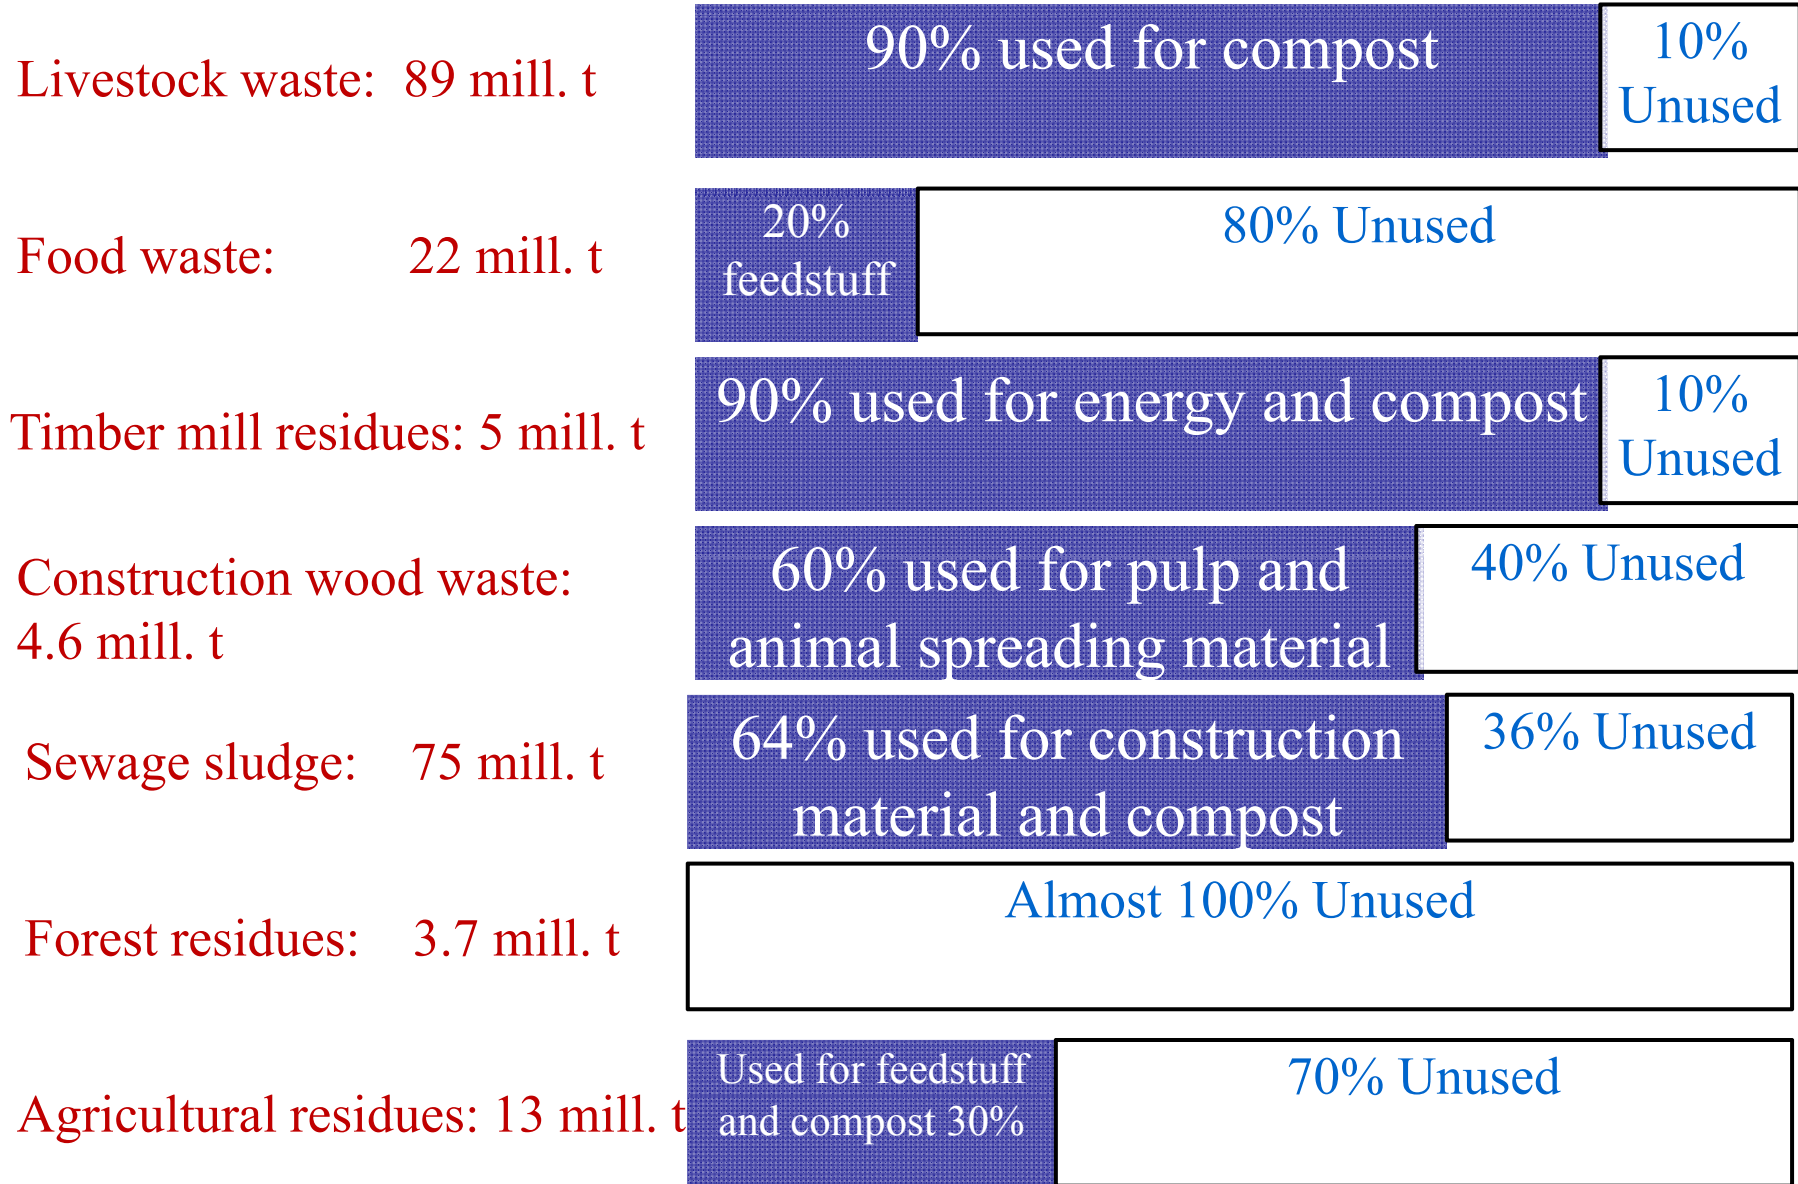

Final Disposal Amount

- Reducing the amount of incineration and landfill disposal
- Recovering recyclable resources from wastes

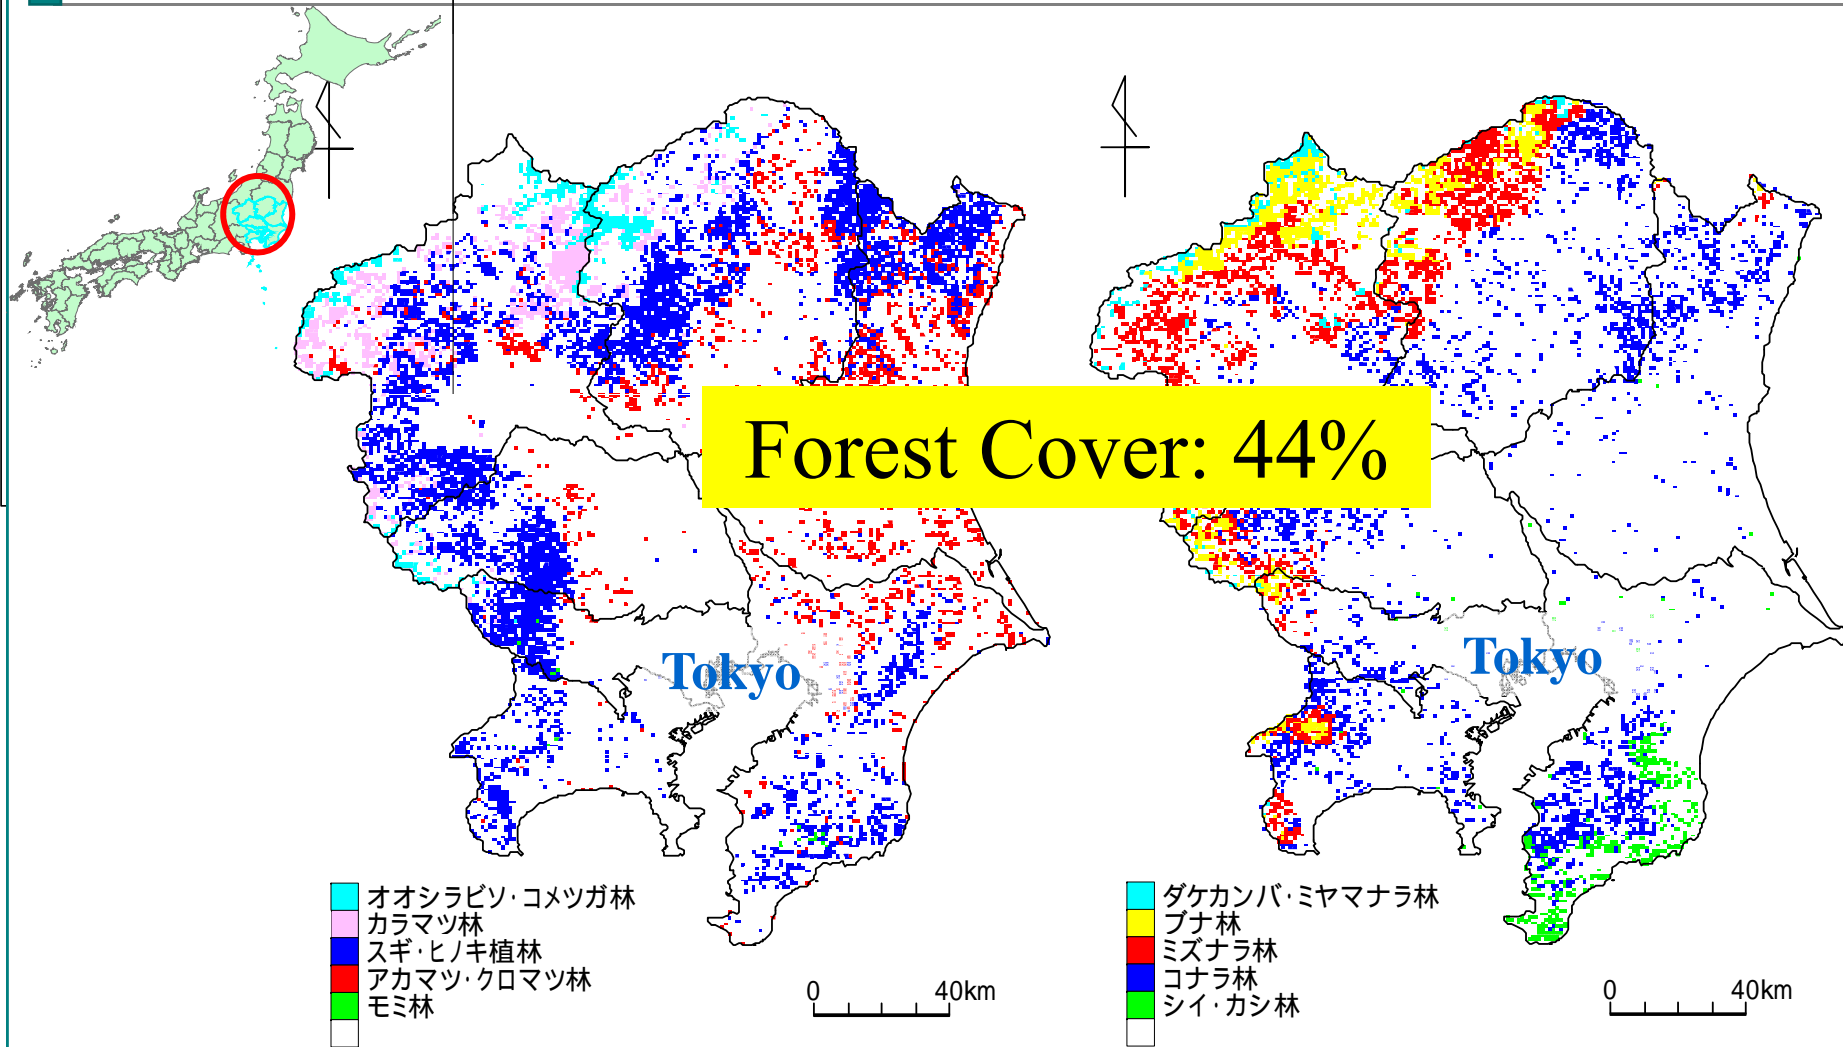

Cyclical Use Rate

- Lengthening materials / products utilization time (leasing, sharing, design for maintainability)
- utilizing of the recovered materials / products in original and principal production system

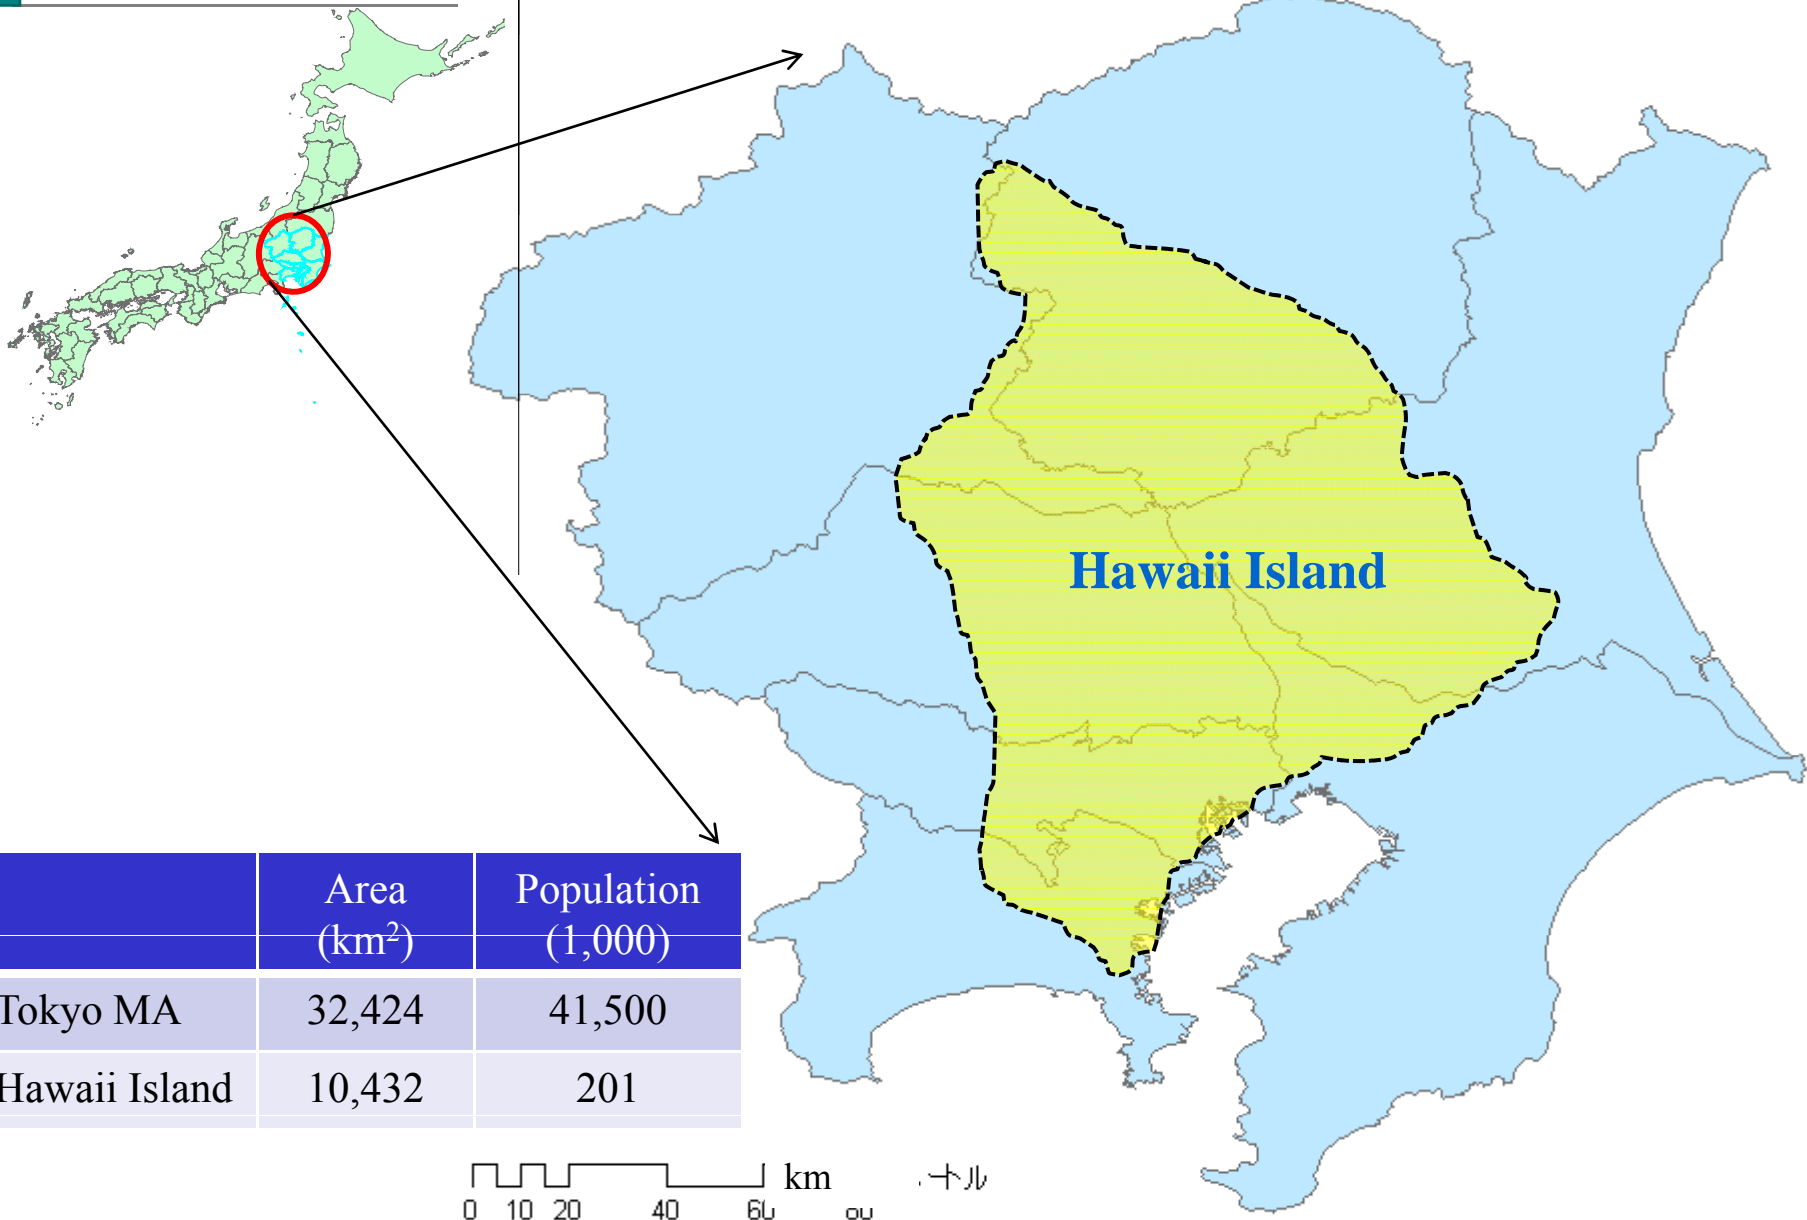

Major biomass waste emission and utilization in Japan(2005)

Forest covers in Tokyo Metropolitan Area

Tokyo Metropolitan Area and “Big Island”

Material flow changes in secondary woodland

Year of 1950 **[Stock]**

Available logs and timbers
in Tokyo MA:
5,090,000m³

[From outside of Tokyo MA]

Charcoal , firewood etc:
6,580,000m³

[Utilization]

Total utilized volume: 11,670,000m³

- Bundle of twigs: 1,980,000m³ (17%)
- Firewood: 3,400,000m³ (29%)
- Charcoal: 6,210,000m³ (53%)
- Shitake mushroom: 20,000m³ (0.2%)

Dry mushroom:
39t

Year of 2000 **[Stock]**

Available logs and timbers
in Tokyo MA:
3,000,000m³

[From outside of Tokyo MA]

Logs for Shiitake
mushroom: 15,000m³

Import of Shiitake
mushroom: 450,000m³

[Utilization]

Total utilized volume: 630,000m³

- Charcoal: 30,000m³ (5%)
- Shiitake mushroom :590,000m³ (95%)
(From Tokyo MA: 150,000m³)

Dry mushroom:
526t
Fresh mushroom:
18,407t

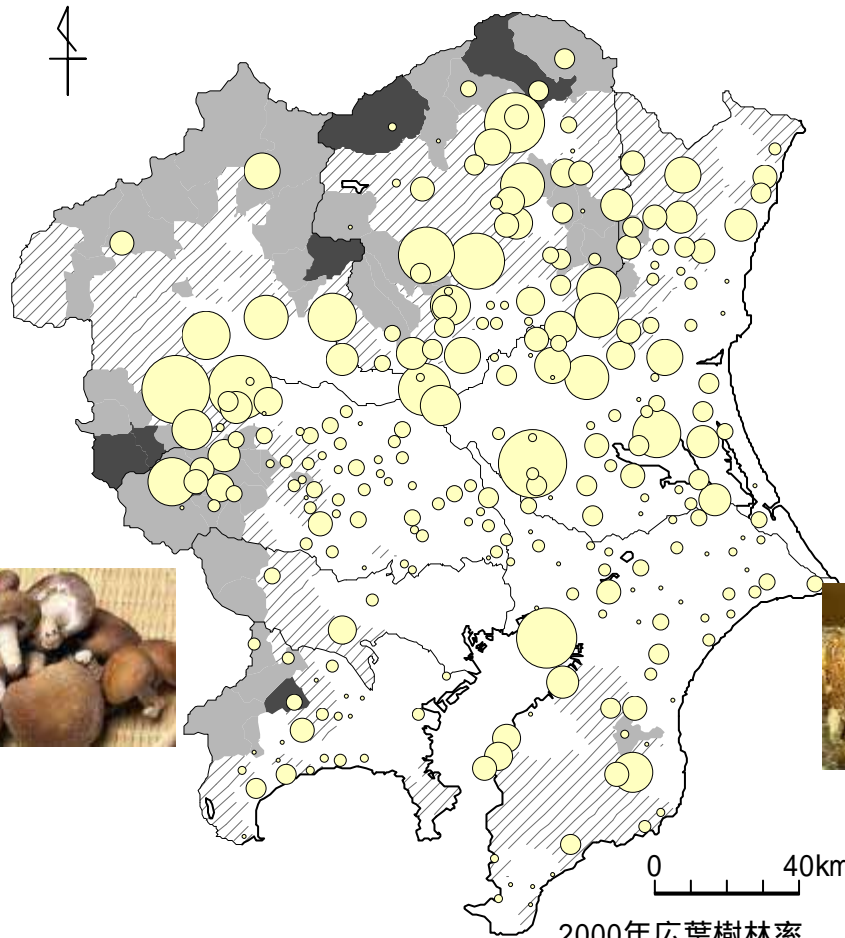

Decrease by 95%

Imports as food (from China)

Dry shiitake: 1,442t
Fresh shiitake: 13,983t

Accounting as logs volume

3. Agricultural landscape and ecosystem services in Japan

(1) Satoyama (Japanese traditional agricultural landscape) and its ecosystem services in Japan

(2) Changes in Satoyama and ecosystem services

What are *Satoyama*

Satoyama ≈ Japanese term for traditional rural landscapes

- Comprises human settlements and several types of ecosystems
 - secondary forests, agricultural lands, irrigation ponds, grasslands, etc.
- Formed/developed through prolonged interaction between humans and ecosystems.
- Connotes a traditional way of life
 - Interaction is central to the management of the ecosystems
- More than 40 per cent of Japan's total landmass
 - many found in rural districts
- Conceptual issues
 - Various terminologies, different definitions, no appropriate English translation

What are *Satoyama* and *Satoumi*?

Satoyama Landscape

里地里山の保全・再生モデル事業イメージ

Coppice Woods

<http://www.env.go.jp/nature/satoyama/pamph/index.html>

Ecosystem Services from *Satoyama*

Provisioning Services	Regulating Services	Supporting Services	Cultural Services
<ul style="list-style-type: none"> - Rice - <i>Sake</i> - Fish - Wild edible plants - Charcoal - Bamboo shoots (<i>takenoko</i>) - Mushrooms (e.g. <i>Matsutake</i>, <i>Shitake</i>) - Genetic resources - Medicinal plants - Berries - Bush meat - Timber - Water, etc. 	<ul style="list-style-type: none"> - Climate control (in Japan) - Local air quality control - Flood control - Erosion control - Landslide control - Water quality control - Water filtration - Control of wild animals Population - Pest control - Habitat for migrating birds - Pollination control - Buffering against acid rain and dust, etc. 	<ul style="list-style-type: none"> - Nutrient cycling - Groundwater supporting - Carbon storage, etc. 	<ul style="list-style-type: none"> - Eco-tourism - Traditional knowledge - Symbols and heritage of Japanese culture - Spiritual monuments and objects (e.g. temples, mountains) - Folklore - Festivals (<i>Matsuri</i>) - <i>Amasan</i> (traditional female divers), etc.

Crises of *Satoyama*

Satoyama is declining and disappearing

Drivers of change (multiple causes):

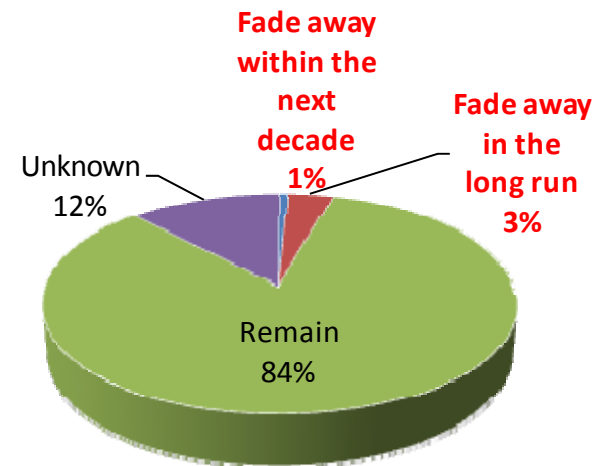

- ❑ **Abandonment**
- ❑ **Ageing**
- ❑ **Depopulation and Rural-Urban migration (out-migration of younger workforce)**
- ❑ Declining economic value of agro-forestry products
- ❑ Global trade
- ❑ Shifting trends in energy consumption (since energy revolution of 1950s)
- ❑ Urbanization, construction and development
- ❑ Invasive Alien Species (e.g. Black bass).
- ❑ Change in sense of commons: Unclear property rights and stronger expression of rights and interest in what was considered as commons

Depopulation and Rural Abandonment in Japan

Fading Rural Settlements:

- 4,849 rural settlements (3.4% of total settlements) have less than 9 households, and 1,403 settlements among them are expected to lose the remaining households (fading away).¹⁾
- Out of 62,271 rural settlements in the depopulated regions, 442 settlements (0.7%) will be abandoned within the next decade and 2,219 settlements (3.6%) will fade away in the long run.²⁾

1) Ministry of Agriculture, Forestry and Fisheries, 2006)

2) Ministry of Land, Infrastructure, Transportation and Tourism, 2007)

Consequences of Change

Function, use and value will diminish with the decline and disappearance.

- Impact on national / local economy.
 - *e.g., food: self-sufficiency rate of vegetables in Japan declined from 100% in 1965 to 82% in 2003, and that of mushrooms does from 115% to 77% in the same period (Japan MAFF, 2004).*
- Loss of biodiversity.
- Erosion of cultural heritage: traditional knowledge, diet culture, festivals, etc.
- Disasters (attacks by bears, destruction to food crops by monkeys).
- Increasing the gap between rural and urban areas.

Gap between fine ecological studies and studies on ecosystem services

An aerial photograph of a golf course, showing the layout of the fairways, greens, and surrounding landscape. A grid is overlaid on the image. A semi-transparent grey box is centered over the image, containing the title text.

4. Sustainability of Resort Industry in Japan

(1) Resort development in the Tokyo Metropolitan Area

(2) Redundant golf courses

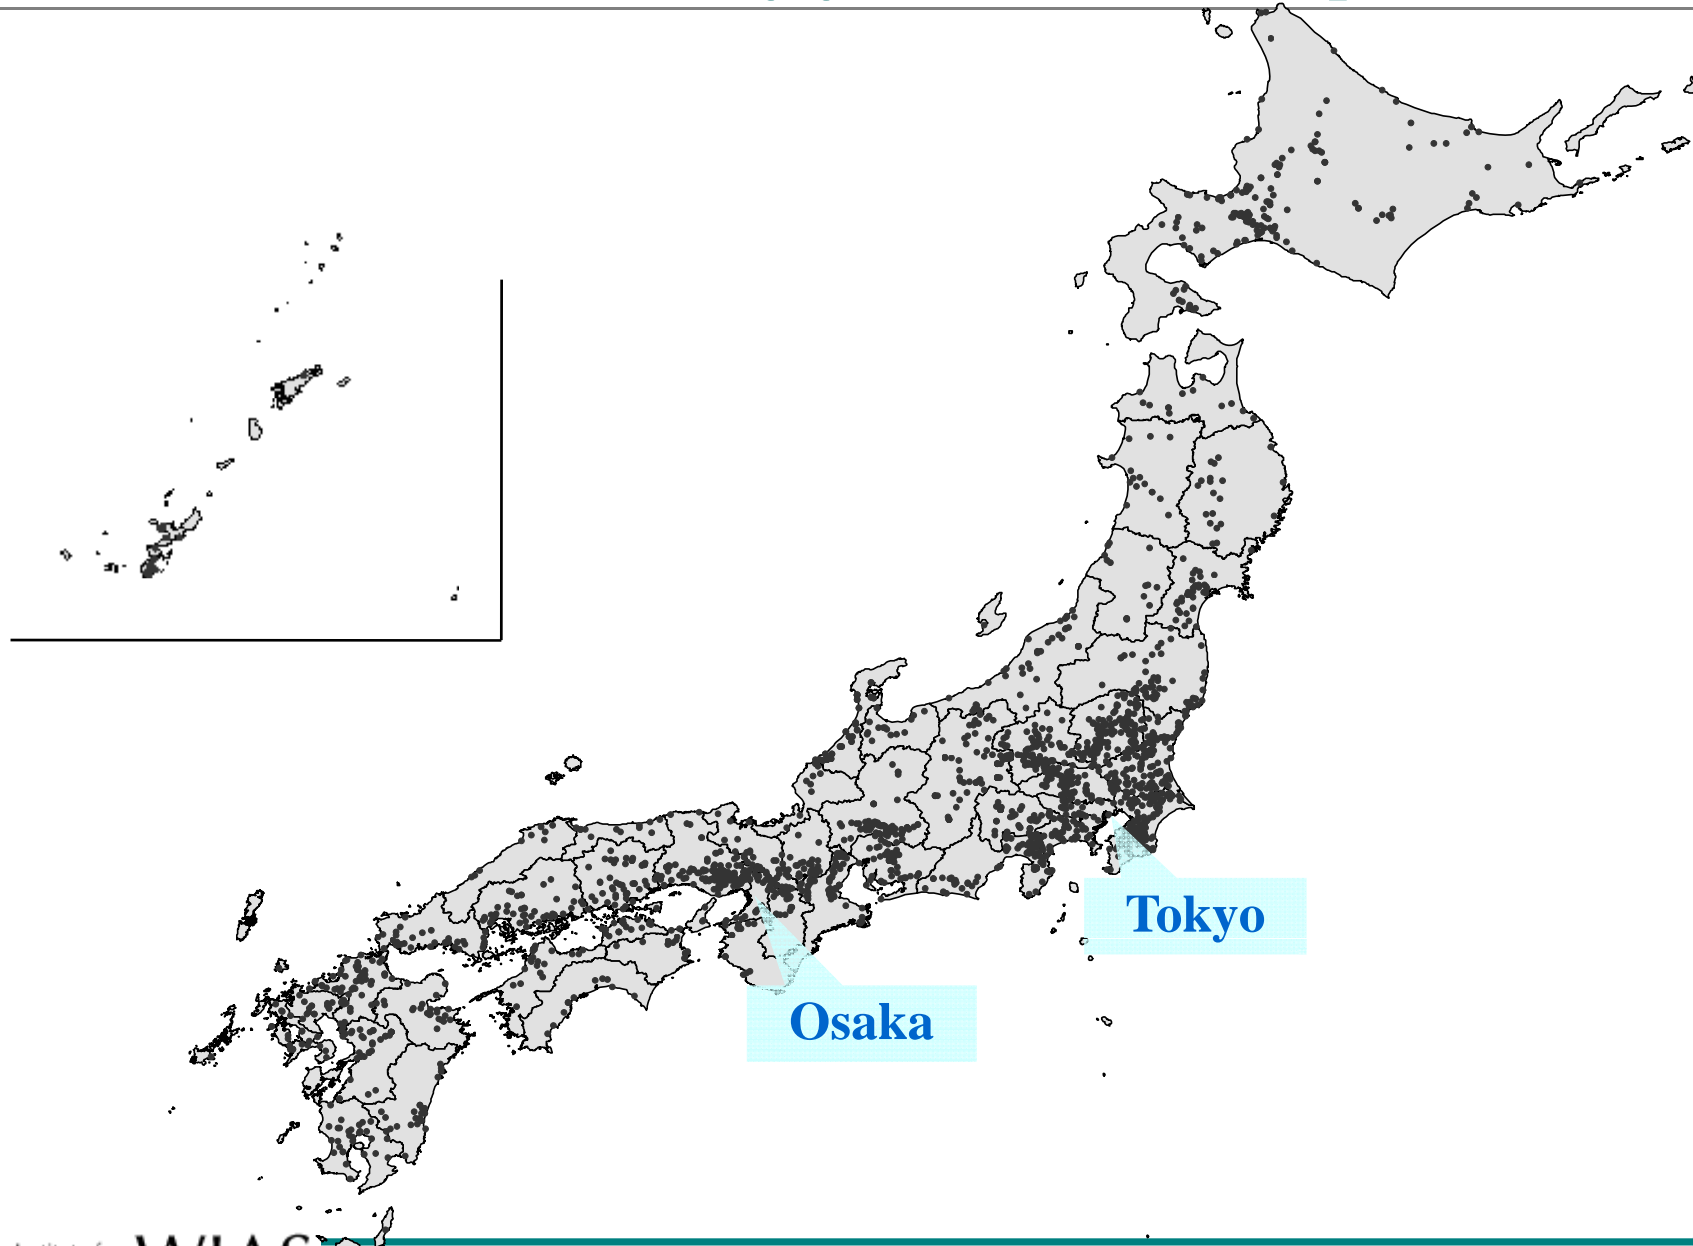

(3) Alternative Management Options for Restructuring

Redundant Golf Courses

The abandoned clubhouse

Landslide and erosion

(3) Alternative Management Options for Restructuring Redundant Golf Courses

a) Multi-purpose space (park)

d) Reforestation

b) Cemetery

e) Pasturing

c) Biofuel feedstock plantation and storage site for biomass feedstock

f) Abandonment

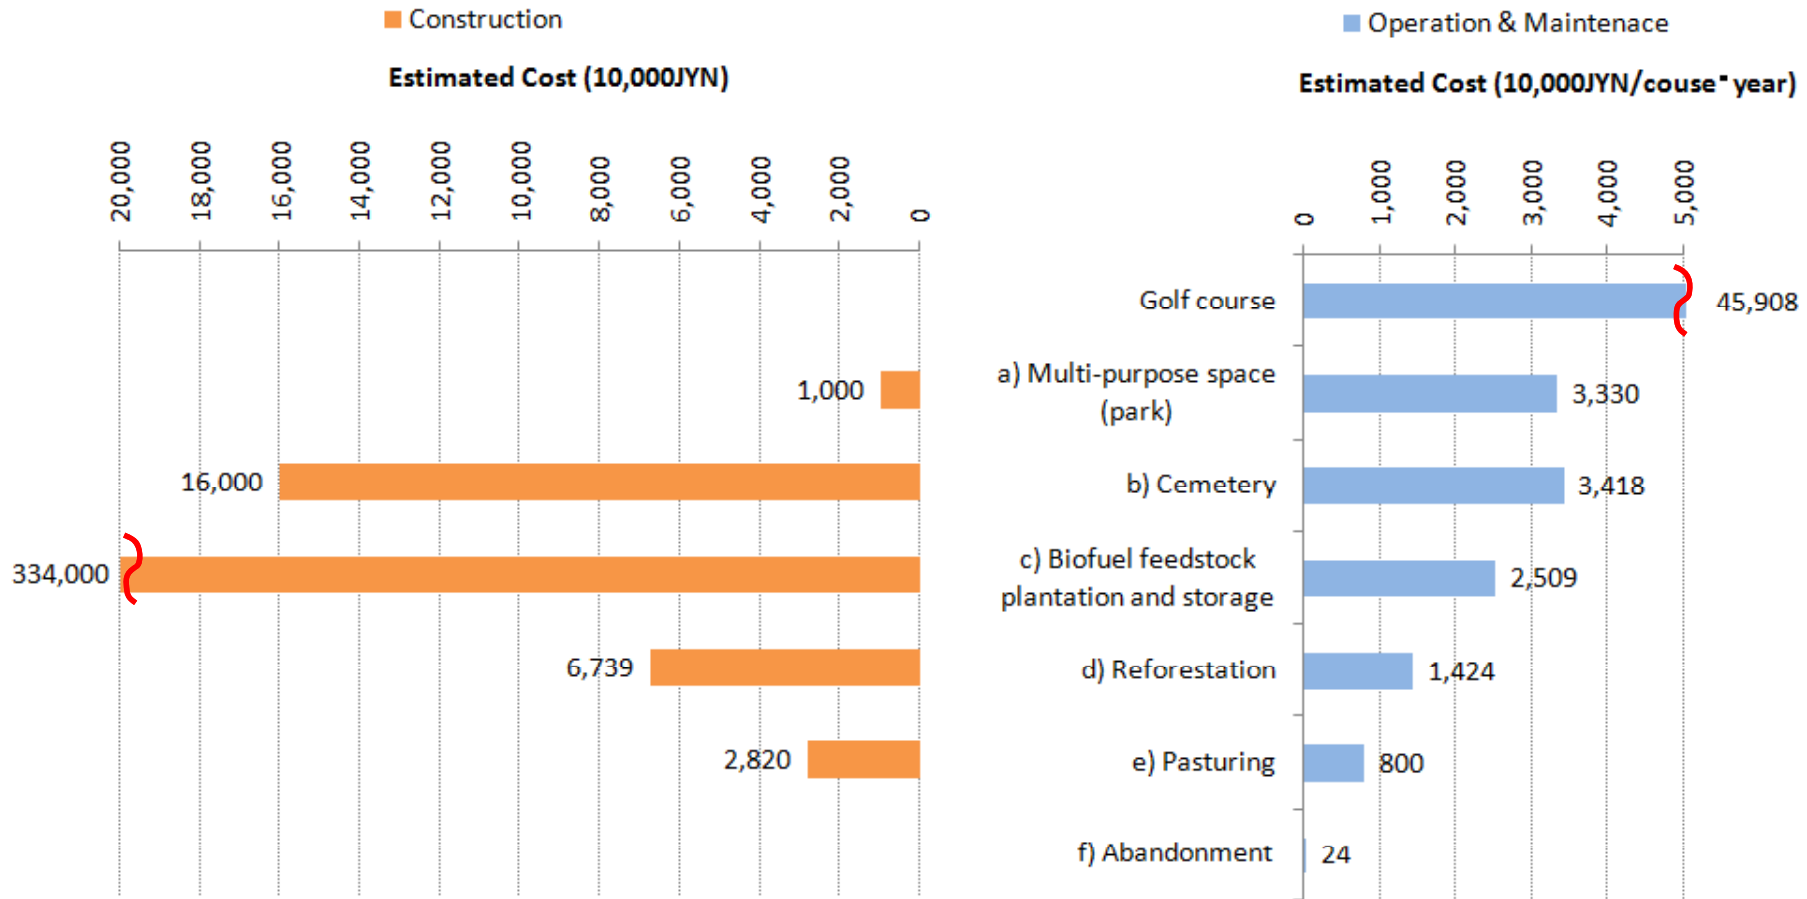

Options	Environmental impacts	Social and economic impacts
a) Multi-purpose space	The space can be also utilized as a nature restoration site or even a disaster control site	Citizens can enjoy walking, sports and other recreational activities
b) Cemetery	Avoid or minimize additional forest destruction associated with cemetery development	Resolve a deficient cemetery supply in peri-urban areas
c) Biofuel feedstock plantation and storage site for biomass feedstock	A net life cycle CO ₂ sequestration of 3.3-4.4 ton ha ⁻¹ year ⁻¹ of CO ₂ (Tilman et al., 2006) The redundant courses can supply storage space not only for feedstock of perennials, but also for other cellulosic resources like forest thinning and agricultural residues	Promote rural industry and create employment opportunities
d) Reforestation	Improve biological diversity and enhance carbon sequestration and water-retaining functions as well as restore rural landscape	Fields for action-based environmental education
e) Pasture	Pasturing can deter degradation of the land and other negative impacts caused by abandonment with relatively low cost and labour	Livestock production would provide economic benefit
f) Abandonment	Recovering to forests in the long run. Soil erosion and illegal dumping of industrial waste should be monitored	Damages on agricultural production by wild boars Landslide disaster potential

GHG Emission Estimation of Six Options

(The darker options are, the more applied to the scenario)

Result of the scenario analysis

Summary of redundant golf courses in Japan

- ◆ This study
 - reviewed developmental history of golf courses in Japan and estimated that **152 (23%)** golf courses will be redundant by the year 2035 in Tokyo MA.
 - identified **302 golf courses** that are or will be soon approaching redundancy through the spatial distribution analysis.
 - described **six alternative management options** for restructuring the existing golf courses as a sustainable infrastructure.
 - attempted **environmental and economic assessment** of six management options
